Our mission

When it comes to industry automation, our mission is to empower robots with eyes and thus independent thinking. The continuous coordination of the eyes and hands is a very simple task for the human brain, it is repeated several millions of times every day. However, this process is quite difficult for a robot to grasp if it is not about a continuously repeated, fixed movement. Among others, this is what we intend to simplify and clarify with our developments.

Bin Picking

In frame of BOWI further improvement steps on current prototype

Usually the speed of automated production line gives little time for the system to rearrange the parts in the bin by the robot in order to be able to grip the part properly. Thanks to improvement of AI and neural network solution the operation speed of prototype bin picking solution will be increased.

Based on the improvement of the current prototype capabilities the system will be able to offer solution in case of every layout condition.
